SUBJECT. STEAM CLEANING ACTIVITIES - BUILDING 331

A question arose whether the steam cleaning activities taking place in the garage shops (Building 331) involve RCRA-regulated wastes. This concern was raised since the rinse/wash water frequently washes down street/pavement areas to culverts. Environmental Management is aware of this activity and has assessed that it presently does not represent a problem for the plant. The only wash water discharged outdoors by the garage originates from vehicle washings. The MSDS sheets were checked on the detergent used and reverified that it does not contain RCRA-regulated compounds. Individual parts cleaning is done indoors with subsequent wastes collected in holding tanks for sampling/analysis prior to disposal. All waters discharged indoors go to a building drain and ultimately to the sanitary treatment plant (Building 995).

Please contact me if you have any questions or require additional information on this topic.
